PROMT Translation for communication via videochat

On May 28, 2013 PROMT Translation Server Developer Edition Solution was integrated into Vichatter service.

Vichatter is a social net focused on the video communication and chatting. People living in different cities are getting acquainted and communicate by means of this service. The majority of Vichatter users are residents of Russia and Ukraine (50 and 15% respectively), however 15% of Vichatter users are living in the USA, and 10% are residents of Germany. Of course, it would be convenient for all of them to communicate in native language, not in foreign one.

Nevertheless, PROMT solves this problem: great online talkers can type their messages in their native language, and their partners will see the text translation..

PROMT Translation Server Developer Edition solution used here is best suited for integration into website thanks to open API availability. The solution was additionally set to work with slang and personal correspondence for more accurate translation of informal phrases.

"We aim to give people all opportunities for joyful and interesting communication", - the service representatives tell. – Our users can easily find friends all over the world after PROMT translation integration. We are living in the XXI century, so there is no more need to think about linguistic barriers, if it's possible just to customize the machine translation".
