Machine
Translation
for SharePoint

PROMT for SharePoint

Main tasks of PROMT for SharePoint

PROMT for SharePoint was developed to make working with the corporate portal more efficient. It provides the transparent capability of translating and formatting documents in different languages.

Portal users gain the following capabilities:

- Text translation
- Document translation
- Translation of portal pages
- Navigation of a multilingual portal in their native language (“through translation”)

PROMT for SharePoint

Scenarios of integrating translation functions in SharePoint

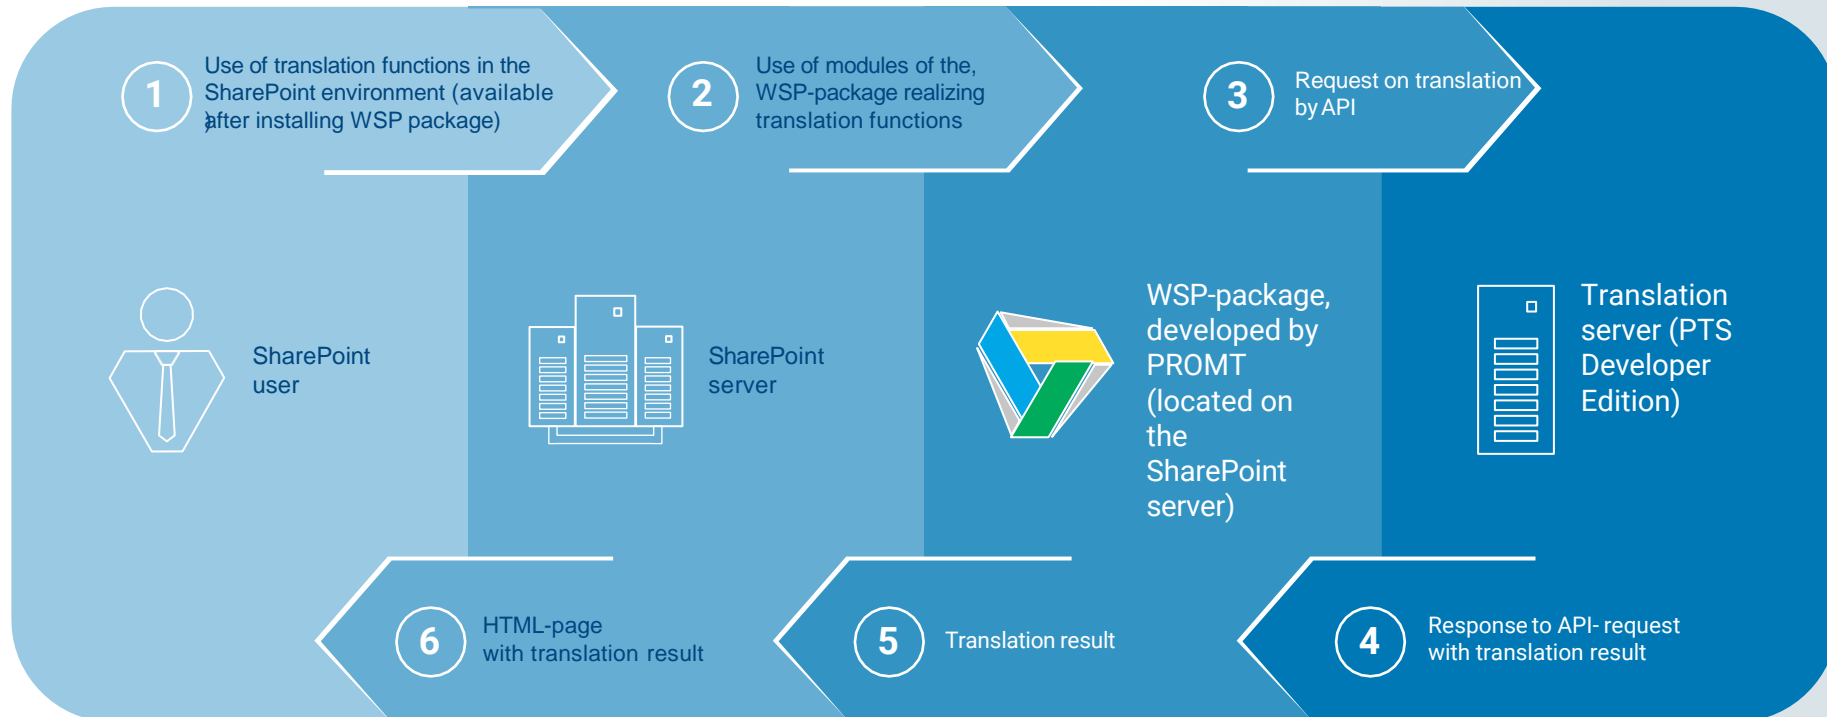

PROMT for SharePoint was developed on the basis of the company's flagman product, PROMT Translation Server.

There are three main scenarios for including the translation server in a portal built on the SharePoint platform:

- the use of a ready-made WSP-package developed by PROMT;
- independent realization of the integration module by portal developers;
- independent realization by portal developers of the "through translation" module for users to navigate the portal in their native language (based on the example provided by PROMT)

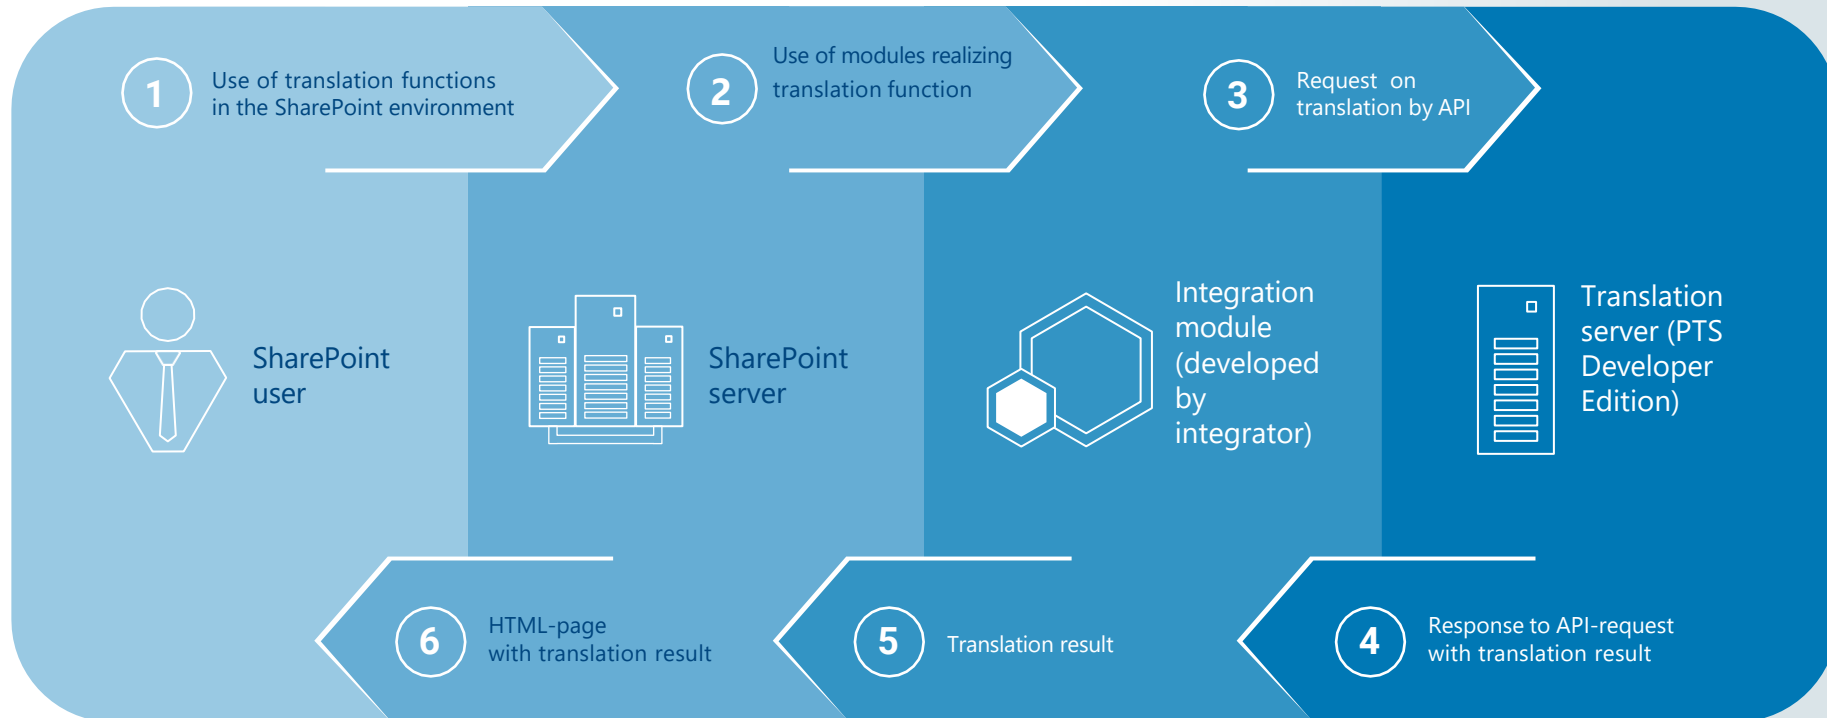

PROMT for SharePoint

Scenario for an integration module based on the PROMT WSP-package

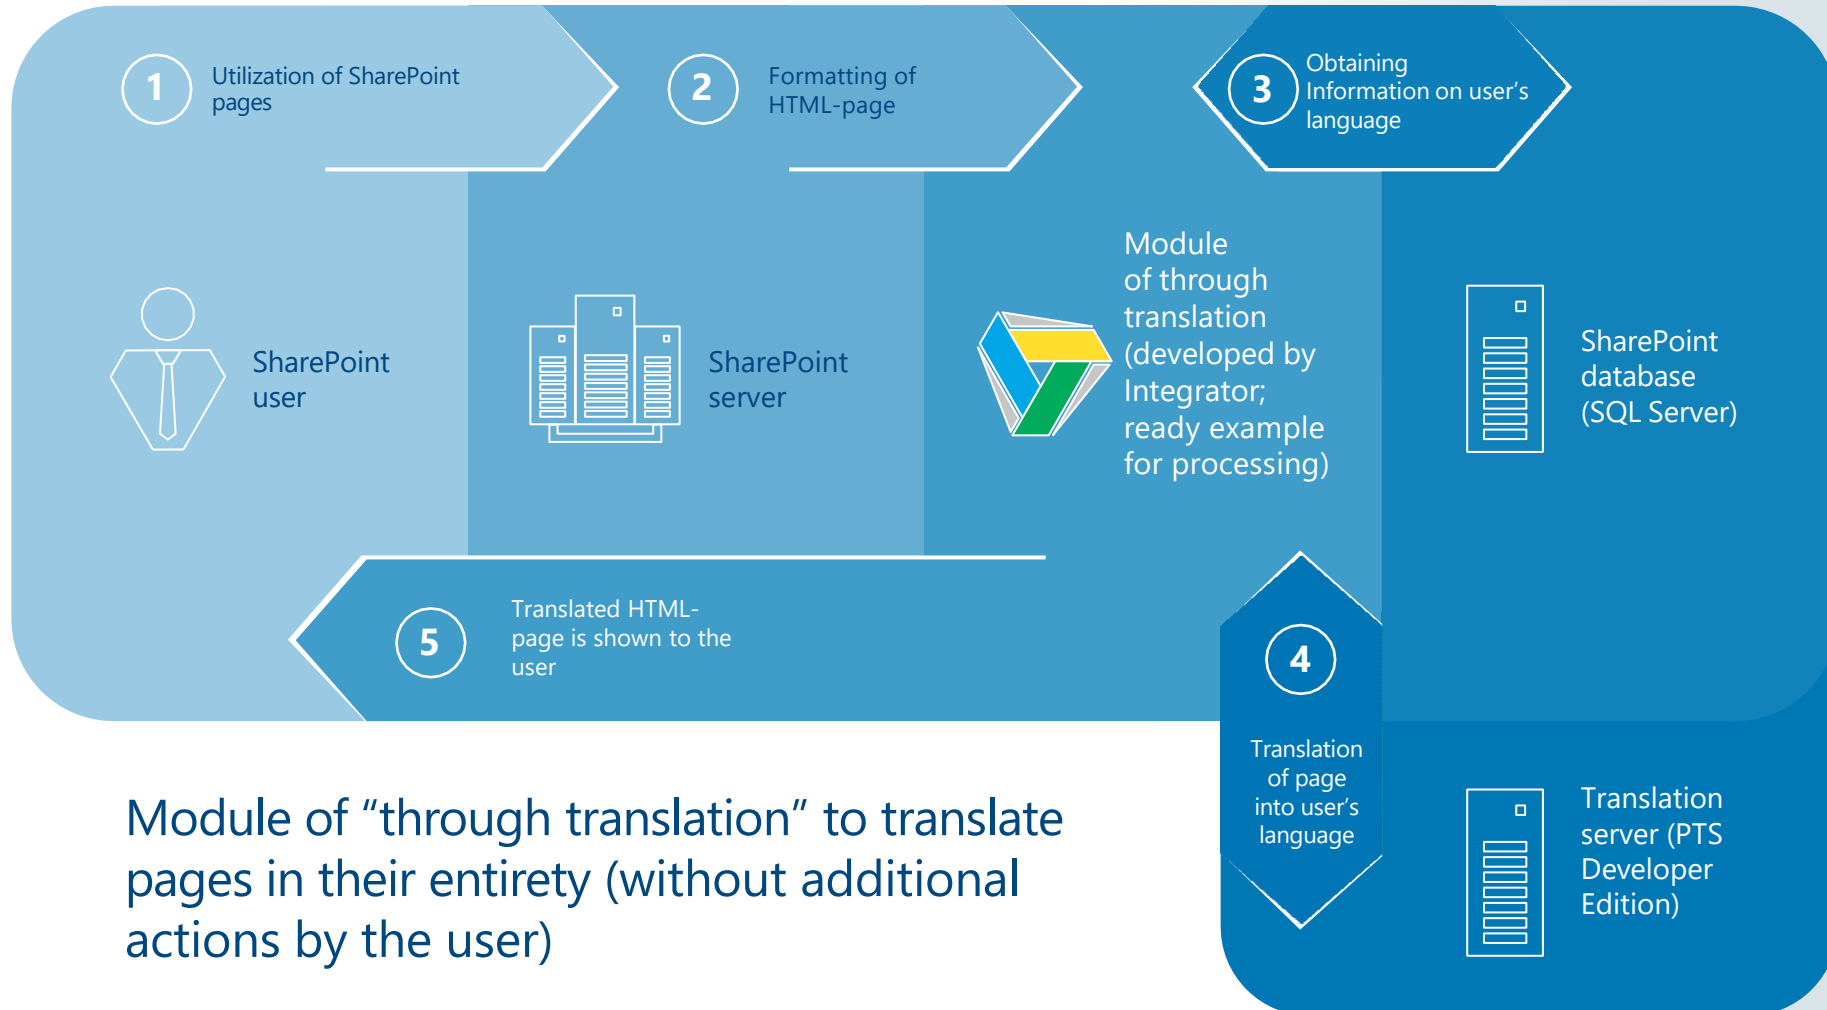

PROMT for SharePoint

Scenario with integration model realized by portal developers (integrator)

PROMT for SharePoint

Scenario with integration module for through translation

Module of "through translation" to translate pages in their entirety (without additional actions by the user)

PROMT for SharePoint

Example of text translation in WSP-package

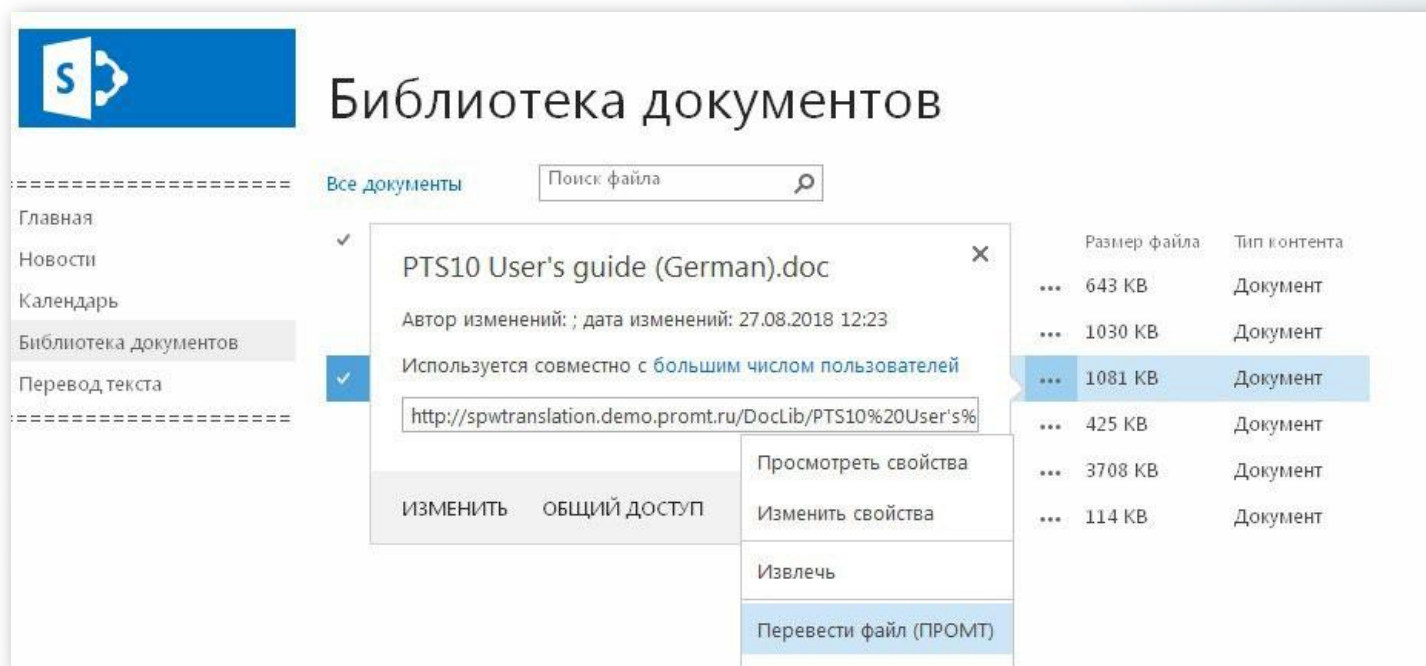

- Translation of any unformatted texts
- Auto-detecting of language, type of text and topic

PROMT for SharePoint

Example of document translation in WSP-package

- Translation of documents in MS Office, PDF, XML, HTML formats and others
- Auto-detecting of language, type and topic of document
- Complete confidentiality in translation

PROMT for SharePoint:

Example of **through** translation of portal page

- Automatic translation of portal page into user's language when page is opened
- Auto-detecting of language and topic of page

The image displays two overlapping screenshots of a SharePoint portal interface. The top screenshot shows the main page with a sidebar menu and a news section. The bottom screenshot shows the same page after translation, with the text and menu items in Russian. The news section contains three items: "PROMT Translator won first place in a competition of machine translators", "The Internet is not necessary; new PROMT Offline for iOS with additional languages and functions", and "The translator and the dictionary for Windows Phone 8 without the Internet".

Why this portal and how to work with it?

This demo portal shows the solution of PROMT for the translation of enterprise portals on the basis of SharePoint 2010-2013. The proposed solution represents **additional modules which is established on the server with SharePoint** and make a machine translation through the PROMT translation server (which it can be established both on a platform of the PROMT company, and in a corporate network of the customer). Thus the corresponding functionality is integrated into the SharePoint interface, i.e. the end user at the translation of texts, pages and documents does not leave the SharePoint web interface.

On this demo portal the following modules are available:

1. **The HTTP handler for machine translation of the page entirely** (function does not involve the user interface, but it can be disconnected by the user through a translation panel). When following the hyperlinks on the translated page of a portal the landing page will be automatically translated.
